

Not only does broadband over power lines interfere with HF radio badly enough to endanger military, aeronautical, naval and emergency communications and minority/religious freedom of speech, but tests in other countries (eg. Germany) have shown that broadband over power lines sends out so much interference that it can interfere with ITSELF.

That's right, if your neighbors have broadband over powerline, not only can you no longer listen to the radio, but you will also be unable to use broadband over powerline yourself, lest it interferes with the internet use of your neighbors.

Please, let the FCC not grant a license for this technology. Not only is it a waste of our money and a danger to national security (interference with military communications), but the money would be much better spent on technology that doesn't interfere with itself, so everybody could use the internet without disturbing each other.
